

Modular Ducting System

Available in stainless steel or galvanised mild steel, this uses a flange and clamp arrangement for connection of mating sections. This method of ducting allows for ease of installation and readjustment without having to cut, rivet and seal joints. This ducting system is available in diameters of 75mm / 100mm / 150mm and 200mm. It also has the added benefit of being easily installed and maintained.

Please Note – any ducting runs between the Blower and Airknife will need careful consideration as significant losses in pressure and performance can easily occur if some simple rules are not followed.

ACI's Sales Team will give their expert advice on all ducting layouts which includes straight, telescopic and angular sections; swept bends; Y Splitters; Reducers; Multiple take offs; Diverter valves; Swept branches; Adaptors; Silencers; Clamps and Mounting Brackets.
